

## Control Volume Derivation

- How to convert our relationships for a closed system (**control mass**) to an open system (**control volume**)
- For mass conservation, our control mass “law” was

$$\frac{dm_{\text{sys}}}{dt} = 0$$

- In integral form (integrating over control mass),

$$\frac{d}{dt} \int_{\text{CM}} \rho dV = 0$$

## Control Mass/Control Volume

- Consider general control mass and control volumes that are moving in time; coincide at time  $t$
- Want to see how to convert CM law to CV law

$$\frac{d}{dt} \int_{\text{CM}} \rho(\vec{x}, t) dV = 0$$

- Must integrate 3-d integral over time dependent domain

$v_{\text{rel}}$  = relative velocity of material crossing CV's CS  
 $dA$  = differential area element on CV's CS

## Time Derivative of 3-d Integral

- Start with standard limit value definition of derivative

$$\frac{d}{dt} \int_{CM(t)} \rho(\bar{x}, t) dV = \lim_{\Delta t \rightarrow 0} \left[ \frac{\int_{CM(t+\Delta t)} \rho(\bar{x}, t + \Delta t) dV - \int_{CM(t)} \rho(\bar{x}, t) dV}{\Delta t} \right]$$

but  $\int_{CM(t+\Delta t)} \rho(\bar{x}, t + \Delta t) dV = \int_{CV(t+\Delta t)} \rho(\bar{x}, t + \Delta t) dV + \int_{\text{Shaded Region}} \rho(\bar{x}, t + \Delta t) dV$

$$\frac{d}{dt} \int_{CM(t)} \rho(\bar{x}, t) dV = \lim_{\Delta t \rightarrow 0} \left\{ \left[ \frac{\int_{CV(t+\Delta t)} \rho(\bar{x}, t + \Delta t) dV - \int_{CV(t)=CM(t)} \rho(\bar{x}, t) dV}{\Delta t} \right] + \frac{1}{\Delta t} \int_{\text{Shaded Region}} \rho(\bar{x}, t + \Delta t) dV \right\}$$

## Time Derivative of 3-d Integral (con't)

- But [ ] term is definition of derivative

$$\lim_{\Delta t \rightarrow 0} \left[ \frac{\int_{CV(t+\Delta t)} \rho(\bar{x}, t + \Delta t) dV - \int_{CV(t)} \rho(\bar{x}, t) dV}{\Delta t} \right] = \frac{d}{dt} \int_{CV(t)} \rho dV$$

- Use  $dV = \bar{v}_{rel} \Delta t \cdot \bar{n} dA$  with  $\bar{n}$  a vector normal to  $dA$  and pointed outward

- Shaded region term becomes

$$\lim_{\Delta t \rightarrow 0} \left[ \frac{1}{\Delta t} \int_{\text{Shaded Region}} \rho(\bar{x}, t + \Delta t) dV \right] = \lim_{\Delta t \rightarrow 0} \left[ \frac{\Delta t}{\Delta t} \int_{\text{CS of CV at } t} \rho(\bar{v}_{rel} \cdot \bar{n}) dA \right] = \int_{CS(t)} \rho(\bar{v}_{rel} \cdot \bar{n}) dA$$

## Control Volume Form of Mass Conservation

- From previous two equations, we have

$$\frac{d}{dt} \int_{CM(t)} \rho dV = \frac{d}{dt} \int_{CV(t)} \rho dV + \int_{CS(t)} \rho(\vec{v}_{rel} \cdot \vec{n}) dA$$

- Applying mass conservation (LHS=0)

$$0 = \frac{d}{dt} \int_{CV(t)} \rho dV + \int_{CS(t)} \rho(\vec{v}_{rel} \cdot \vec{n}) dA$$

Production rate of mass,  $\dot{P}_{mass}$

Time rate of change of mass inside CV

Net outward mass flow rate crossing CS

Don't have to know mass distribution in CV

$$\dot{P}_{mass} = 0 = \frac{dm_{CV}}{dt} + \sum_{outlets} \dot{m} - \sum_{inlets} \dot{m}$$

## Simplifications

- Uniform flow (at CS)**

$$\int_{CS(t)} \rho(\vec{v}_{rel} \cdot \vec{n}) dA = \sum_{outlets} \rho v_{rel} A - \sum_{inlets} \rho v_{rel} A$$

$$\text{i.e., } \dot{m} = \rho v_{rel} A$$

+ Working in frame of reference where CS not moving

$$= \sum_{outlets} \rho v A - \sum_{inlets} \rho v A =$$

- Steady-State**

$$\frac{d}{dt} \int_{CV(t)} \rho dV = 0 \Rightarrow \sum_{outlets} \dot{m} = \sum_{inlets} \dot{m}$$

## Simplifications (con't)

- **Transient, integrate over fixed time**

$$\int_{t_1}^{t_2} \left[ \frac{d}{dt} \int_{CV(t)} \rho dV \right] dt = \int_{t_1}^{t_2} \left[ \sum_{\text{inlets}} \dot{m} - \sum_{\text{outlets}} \dot{m} \right] dt$$

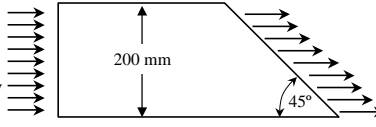

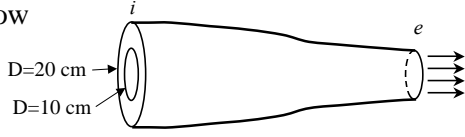

$$\int_{CV(t_2)} \rho dV - \int_{CV(t_1)} \rho dV = \int_{t_1}^{t_2} \left[ \sum_{\text{inlets}} \frac{dm}{dt} - \sum_{\text{outlets}} \frac{dm}{dt} \right] dt$$

$$m_{CV,2} - m_{CV,1} = \sum_{\text{inlets}} \Delta m_{12} - \sum_{\text{outlets}} \Delta m_{12}$$

Change of mass in CV  
between  $t_1$  and  $t_2$

Net amount of mass entering  
CV between  $t_1$  and  $t_2$

## In-Class Problems

1. Nitrogen at 200 kPa and 25°C flows through a 35 mm diam. pipe at 20 m/s. Find the mass flow rate of nitrogen through the pipe.
2. Liquid water enters the square duct shown with an average velocity 10 m/s. Determine the average velocity and mass flow rate at the exit.
 
3. Air flows in a circular pipe with a velocity of 20 m/s. Around the pipe, in an annulus, is a 2nd flow of air, with a velocity of 40 m/s. Both flows exhaust into a 15 cm diam. pipe. If the flow at  $e$  is uniform, determine the flow velocity at  $e$ . Assume the air density is constant.
 

## Differential Form of Mass Conservation For Quasi-1D, Steady Flow

- Assume flow velocity is 1-D (only variation in x) in non-constant area, differential volume

$$\dot{m} = \text{constant} = \rho v A$$

$$0 = d(\rho v A)$$

$$0 = v A d\rho + \rho A dv + \rho v dA$$

$$0 = \frac{d\rho}{\rho} + \frac{dv}{v} + \frac{dA}{A} = \frac{d\rho}{\rho} + \frac{1}{2} \frac{d(v^2)}{v^2} + \frac{dA}{A}$$

- Compare to **continuity**

$$0 = \frac{d\rho}{dt} + \left[ \frac{d(\rho v_x)}{dx} + \frac{d(\rho v_y)}{dy} + \frac{d(\rho v_z)}{dz} \right] = \frac{d(\rho v)}{dx} \Rightarrow \left( \text{strictly, } \frac{dA}{dx} = 0 \right)$$

## Reynolds Transport Theorem

- Provides general form for converting from CM to CV conservation laws
- For given extensive property B, with intensive version  $\beta$  (something per mass), that follows a “conservation” law can show

$$\left. \frac{dB}{dt} \right|_{CM} = \frac{d}{dt} \int_{CV} \rho \beta dV + \int_{CS} \rho \beta (\vec{v}_{rel} \cdot \vec{n}) dA$$

Replace with appropriate Control Mass Conservation Law

- Will also lead to a **PICO** relationship

$$\text{Production} + \text{Input} = \text{Change (in time)} + \text{Output}$$

## Reynolds Transport Theorem: Example

- Example, **linear momentum**

$$\vec{B} = m\vec{v}, \quad \vec{\beta} = \vec{v}$$

- **RTT** then gives

$$\left. \frac{d(m\vec{v})}{dt} \right|_{CM} = \frac{d}{dt} \int_{CV} \rho \vec{v} dV + \int_{CS} \rho \vec{v} (\vec{v}_{rel} \cdot \vec{n}) dA$$

- Use **Newton's Law** e.g., gravity e.g., pressure ( $p dA$ ), shear stress

$$\left. \frac{d(m\vec{v})}{dt} \right|_{CM} = \sum \vec{F}_{on CV} = \sum \vec{F}_{body on CV} + \sum \vec{F}_{surface on CS} (= \dot{P}_{momentum})$$

$$\dot{P}_{momentum} = \sum \vec{F}_{on CV} = \frac{d}{dt} \int_{CV} \rho \vec{v} dV + \int_{CS} \rho \vec{v} (\vec{v}_{rel} \cdot \vec{n}) dA$$

## Momentum Conservation: 1-D Flow

- For **steady inviscid flow, no body forces**

$$\sum_0 \vec{F}_{x body on CV} + \sum \vec{F}_{x stresses from solid CS} - \int_{CS} p \cdot \vec{n} dA = \frac{d}{dt} \int_{CV} \rho \vec{v} dV + \int_{CS} \rho \vec{v} (\vec{v}_{rel} \cdot \vec{n}) dA$$

$$\vec{F}_{x shear stress on CS} - \int_{CS} p \cdot \vec{n} dA = \sum_{outlets} \dot{m} \vec{v} - \sum_{inlets} \dot{m} \vec{v}$$

$$\vec{F}_x + p_1 A_1 - p_2 A_2 + p_{amb} (A_2 - A_1) = \dot{m} v_2 - \dot{m} v_1 = \rho_2 v_2^2 A_2 - \rho_1 v_1^2 A_1$$

$$\vec{F}_x + (p_1 - p_{amb}) A_1 - (p_2 - p_{amb}) A_2 = \dot{m} v_2 - \dot{m} v_1 = \rho_2 v_2^2 A_2 - \rho_1 v_1^2 A_1$$

## Momentum Conservation: 1-D Flow

- Differential form

$$-\tau_x L_p dx + pA - (p + dp)(A - dA)$$

$$-\left(p + \frac{dp}{2}\right)dA = \dot{m}(v + dv) - \dot{m}v$$

$$-\tau_x L_p dx - Adp = \dot{m}dv = \rho v A dv$$

$$\frac{\tau_x}{p} \frac{L_p}{A} dx + \frac{dp}{p} + \frac{\rho v^2}{2p} \frac{dv^2}{v^2} = 0$$

- For **steady, no body forces** and shear stress defined to be in -x direction

- Term comes from

$$F_{x,sides} = \left(p + \frac{dp}{2}\right)(\vec{n} \cdot \hat{x})A_y$$

$$= \left(p + \frac{dp}{2}\right) \sin \theta \frac{dA}{\sin \theta}$$

## Flow Rates and Fluxes

- Flow rate of property** that is **carried by the mass** crossing the control surface (in some direction) is

$$B = \int \rho \beta (\vec{v}_{rel} \cdot \vec{n}) dA$$

$$\text{e.g., } \dot{m} = \rho v A \text{ (kg/s),}$$

$$\dot{m}v = \rho v^2 A \text{ (N) for 1-D flow with stationary CV}$$

- The **flux** of that same property is given by

$$\dot{B}'' = \rho \beta (\vec{v}_{rel} \cdot \vec{n})$$

$$\text{e.g., } \rho v \text{ (mass flux, kg/s/m}^2\text{),}$$

$$\rho v^2 \text{ (momentum flux, N/m}^2\text{) for nonmoving CS}$$
